Bristol Bay in the News May 7, 2013

News that the EPA released a revised Bristol Bay Watershed Assessment and opened a second public comment period was published in more than 50 major newspapers and a number of prominent national websites, including NBC News, ABC News, Politico, The Hill and Huffington Post. The broad coverage included an AP story that reads: "Build-out of a large-scale mine near the headwaters of a world-class salmon fishery in Alaska could wipe out as many as 90 miles of streams and alter stream flows, the U.S. Environmental Protection Agency said in a revised assessment released Friday." In addition, mining activity would destroy at least 24 miles of streams and up to 4,800 acres of wetland habitat.

The updated Assessment affirms the conclusions reached in EPA's May 2012 version and says that stream and wetlands losses due to the Pebble project would lead to diminished fish production downstream. After the second comment period ends May 31, and a concurrent independent science review is complete, EPA will finalize its Bristol Bay report.

Senator Maria Cantwell issued a statement on the Assessment that said, in part: "This report is evidence of the devastating impact that the proposed Pebble Mine would have on Bristol Bay salmon and the thousands of Washington state jobs that depend on them. I look forward to the EPA moving forward and finalizing a Bristol Bay Watershed Assessment. I will continue to fight to protect Washington fishing jobs. Because the future of Bristol Bay must be determined by science, not politics."

Additionally, a group of 300 scientists around the world released a letter commending the EPA for its independent scientific review of Bristol Bay and expressing deep concerns about the Pebble Mine project.

An excerpt of the letter reads: "We would also note that the mine impact scenarios used to estimate risks to fisheries, though based on an industry report for the Pebble prospect, may actually be overly optimistic about such challenges and about the overall management of a large mine. This is particularly important given the sensitivity of aquatic life to very low levels of metals and the potential for effects that could result in a long-term decline of fish populations."

EPA: Alaska Mine Project Could Hurt Salmon Streams

Associated Press

Becky Bohrer

Build-out of a large-scale mine near the headwaters of a world-class salmon fishery in Alaska could wipe out as many as 90 miles of streams and alter stream flows, the U.S. Environmental Protection Agency said in a revised assessment released Friday. The report said mining activity would claim at least 24 miles of streams in the Bristol Bay region, based on the scenarios evaluated, with the loss of wetlands ranging from 1,200 to 4,800 acres...
